Based on

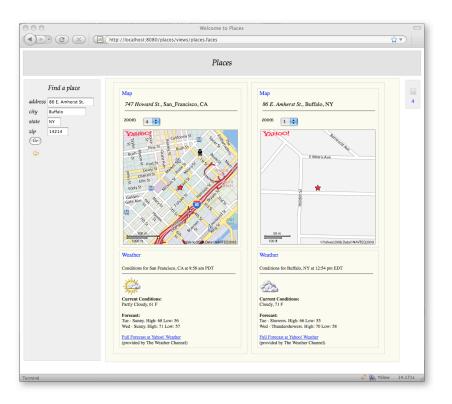

Code

http://code.google.com/p/geary-nfjs

svn co http://geary-nfjs.googlecode.com/svn/trunk/ geary-nfjs-read-only

Demonstration

This session

- Composite components
- Ajax with JSF 2
- Ajax validation
- Ajax progress bar
- Ajax components

Composite components

- Composite components...
 - ...are simple to implement
 - …require no configuration
 - ...support fast iterative development (without redeploying the application)

Using composite components

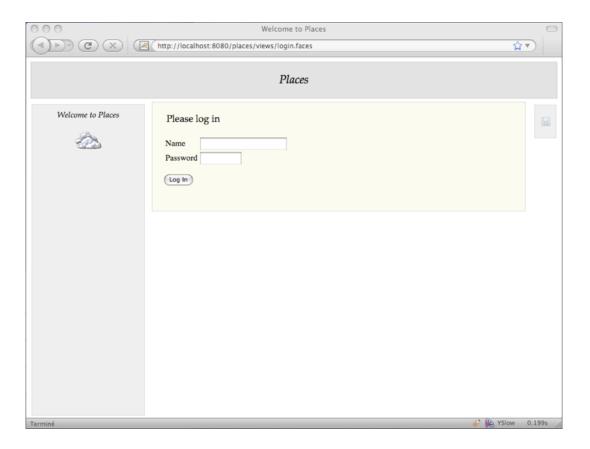

Using an icon

```
<a href="http://www.w3.org/1999/xhtml" xmlns:util="http://java.sun.com/jsf/composite/components/util">
    <util:icon image="#{resource['images:disk-icon.png']}"
        actionMethod="#{sourceViewer.showSource}
        styleClass="icon"/>
        </html>
```

Implementing the icon: attributes

```
<a href="http://www.w3.org/1999/xhtml">html xmlns="http://www.w3.org/1999/xhtml"</a>
    xmlns:h="http://java.sun.com/jsf/html"
 xmlns:composite="http://java.sun.com/jsf/composite">
  <composite:interface>
    <composite:attribute name="image"</pre>
                                            required="true" />
   <composite:attribute name="styleClass" default="icon" />
    <composite:attribute name="actionMethod" method-signature="java.lang.String action()" />
  </composite:interface>
  <composite:implementation>
    <h·form>
     <h:commandLink action="#{cc.attrs.actionMethod}">
       <h:graphicImage url="#{cc.attrs.image}"
                  styleClass="#{cc.attrs.styleClass}" />
     </h:commandlink>
    </h:form>
  </composite:implementation>
</html>
```

Demonstration

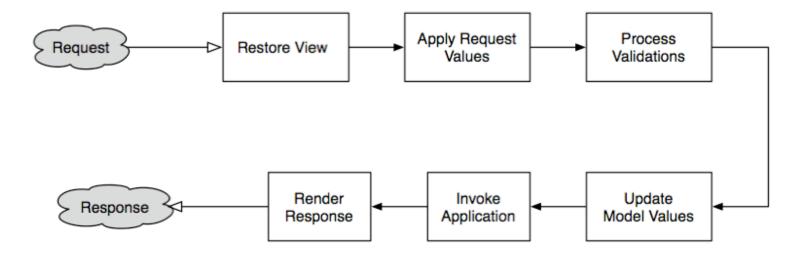

This session

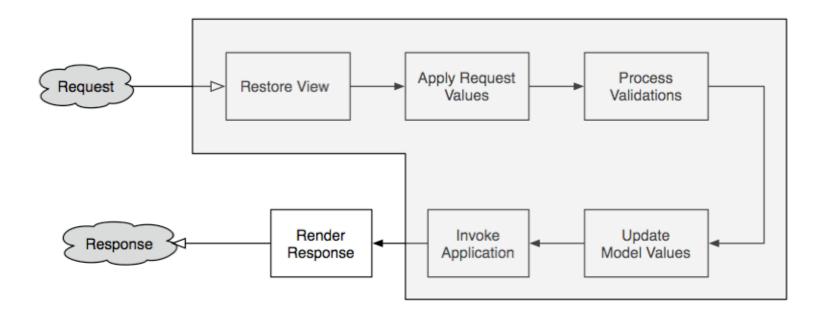

- Composite components
- Ajax with JSF 2
- Ajax validation
- Ajax progress bar
- Ajax components

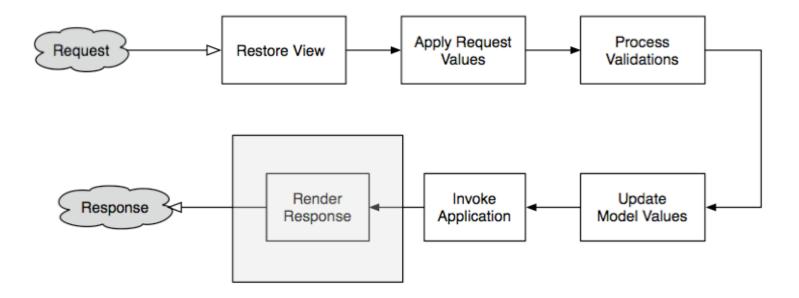

The JSF lifecycle

execute

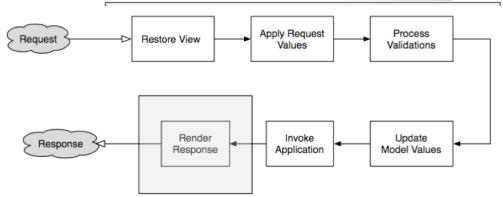

render

Using <f:ajax>

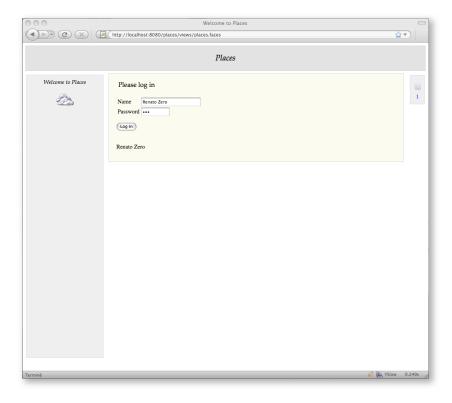

```
<h:inputText id="name" value="#{user.name}">
    <f:ajax event="keyup" execute="@this" render="echo"/>
</h:inputText>
```

. . .

<h:outputText id="echo" value="#{user.name}"/>

Demonstration

This session

- Composite components
- Ajax with JSF 2
- Ajax validation
- Ajax progress bar
- Ajax components

Ajax validation

markup

```
<h:inputText value="#{user.name}"
  valueChangeListener="#{user.validateName}">
  <f:ajax event="blur" render="nameError"/>
  </h:inputText>
<h:outputText id="nameError"
     value="#{user.nameError}"
     style="color: red"/>
```

```
Please log in

Name No_underscores Name cannot contain underscores

Password .....
```

validator

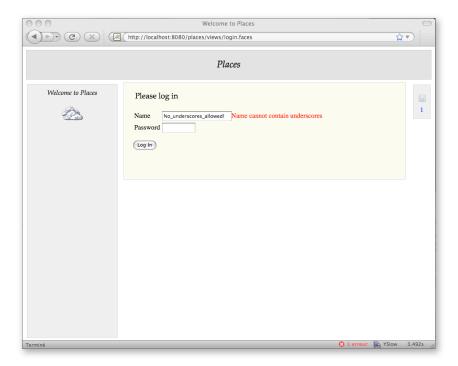

```
public class User {
    private String nameError;

public void setNameError(String error) {nameError = error;}
    public String getNameError() {nameError;}

public void validateName(ValueChangeEvent e) {
    UlInput nameInput = (UlInput)e.getComponent();

    // validate nameInput's value, and store error msg in nameError
    }
}
```

Demonstration

This session

- Composite components
- Ajax with JSF 2
- Ajax validation
- Ajax progress bar
- Ajax components

Ajax progress bar

setting the event handler

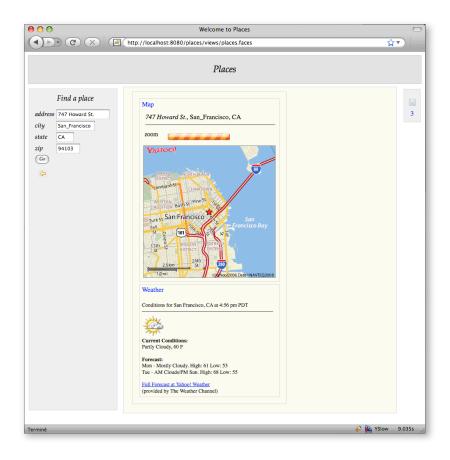

```
<h:selectOneMenu id="menu"
    value="#{place.zoomIndex}">
    <f:ajax render="image" onevent="zoomChanging"/>
    ...
</h:selectOneMenu>
```

the event handler (JavaScript)

```
function zoomChanging(data) {
    ...

if (data.status == "begin") {
    // hide menu and show progress bar
  }
  else if (data.status == "success") {
    // hide progress bar and show menu
  }
}
```

Demonstration

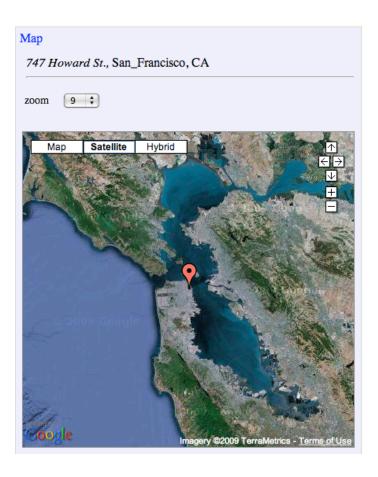

This session

- Composite components
- Ajax with JSF 2
- Ajax validation
- Ajax progress bar
- Ajax components
