

sitecore[®] azure

Enterprise Level Applications on
Windows Azure

Mikkel Høy Sørensen

Technical Manager at Sitecore Corporation

mhs@sitecore.net

sitecore[®] azure

Background

Background

- Technical Manager focusing on 3rd party products and technologies
- Responsible for products to ease integration with these
- Among these are Sitecore Azure
- Sitecore Azure enables seamless integration to Windows Azure

sitecore[®] azure

Building on Windows Azure

Building on Windows Azure

- Any architectural considerations i have to be aware of?
- What are the challenges of building application for Windows Azure?
- Will Windows Azure scale endlessly?
- How difficult is it to convert my existing Application?

sitecore[®] azure

Brief overview of Sitecore CMS

Brief overview of Sitecore CMS

- a Enterprise Content Management System
- designed for endless scaling
- supports multi server and multi location setups
- uses information push forward to high security requirements

sitecore[®] azure

Overall Architectural Considerations

Overall Architectural Considerations

- Runs on shared commodity hardware
- Everything has to be able to scale
- Multiple Geographical Locations
- Address scalability restrictions on single point of access data resources like databases

sitecore[®] azure

Typical setup

Typical setup

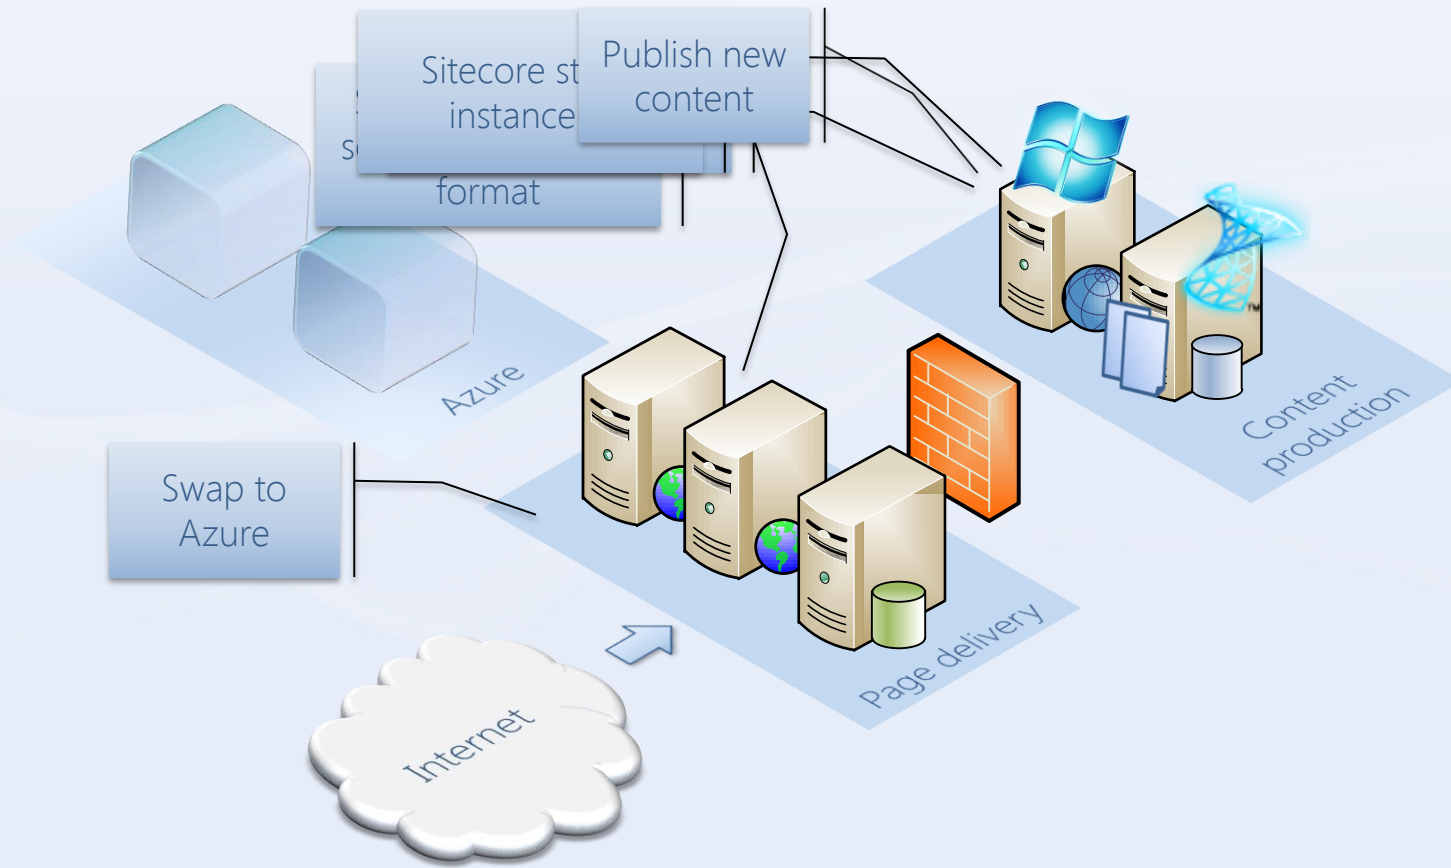

sitecore[®] azure

Sitecore deployment on Azure

Sitecore deployment on Azure

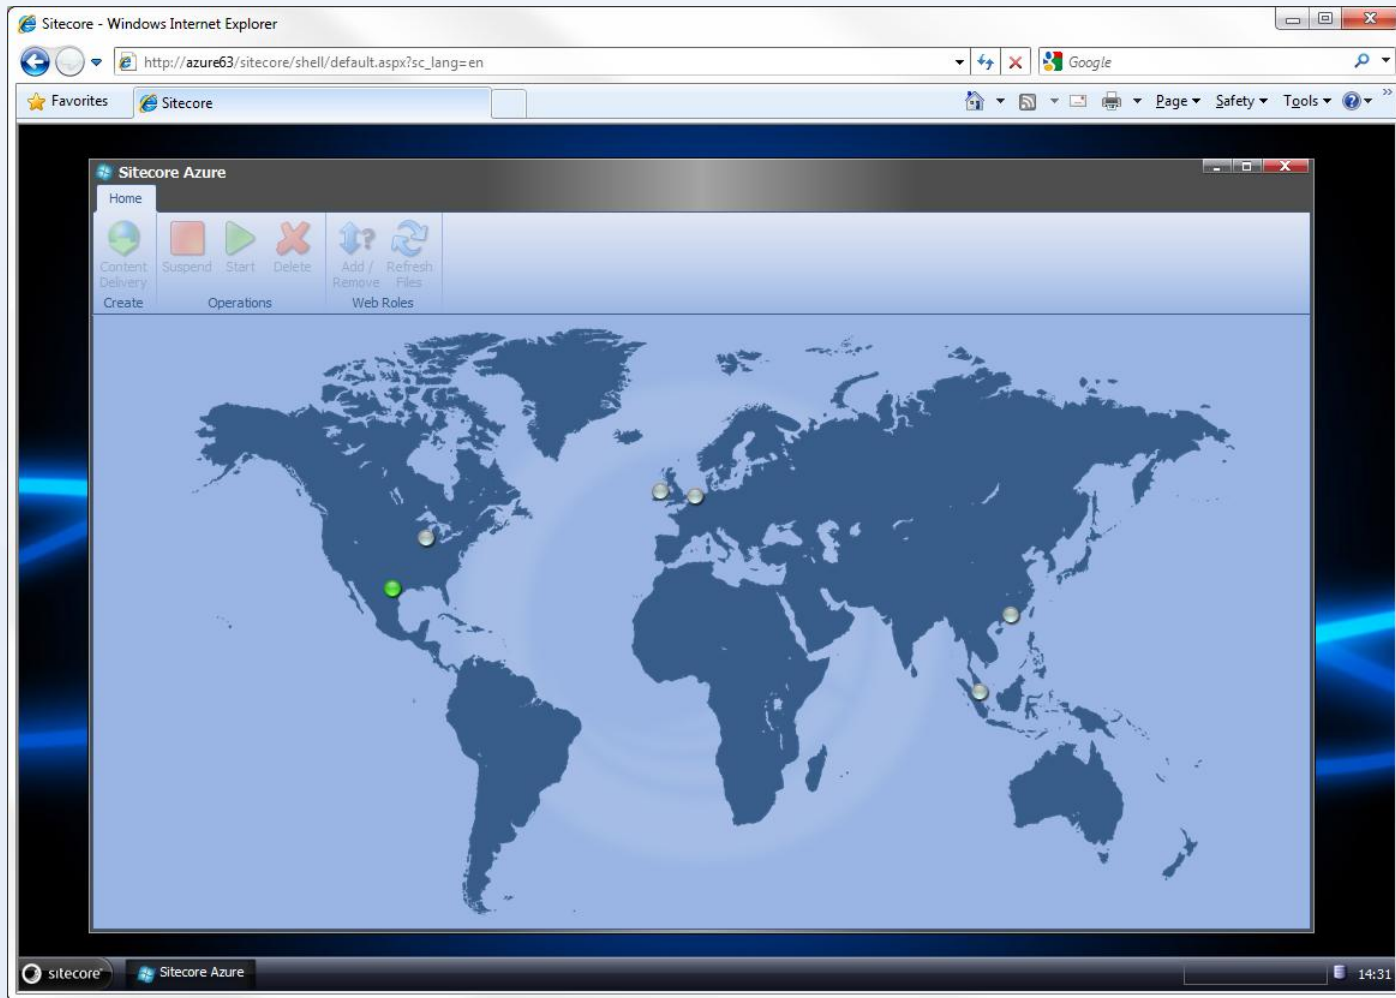

What does the automated deployment do

- Creates cloud databases with published data
- Setup Azure databases as publication targets
- Converts existing Website in to Web Role
- Configures Web Role to run on Cloud databases

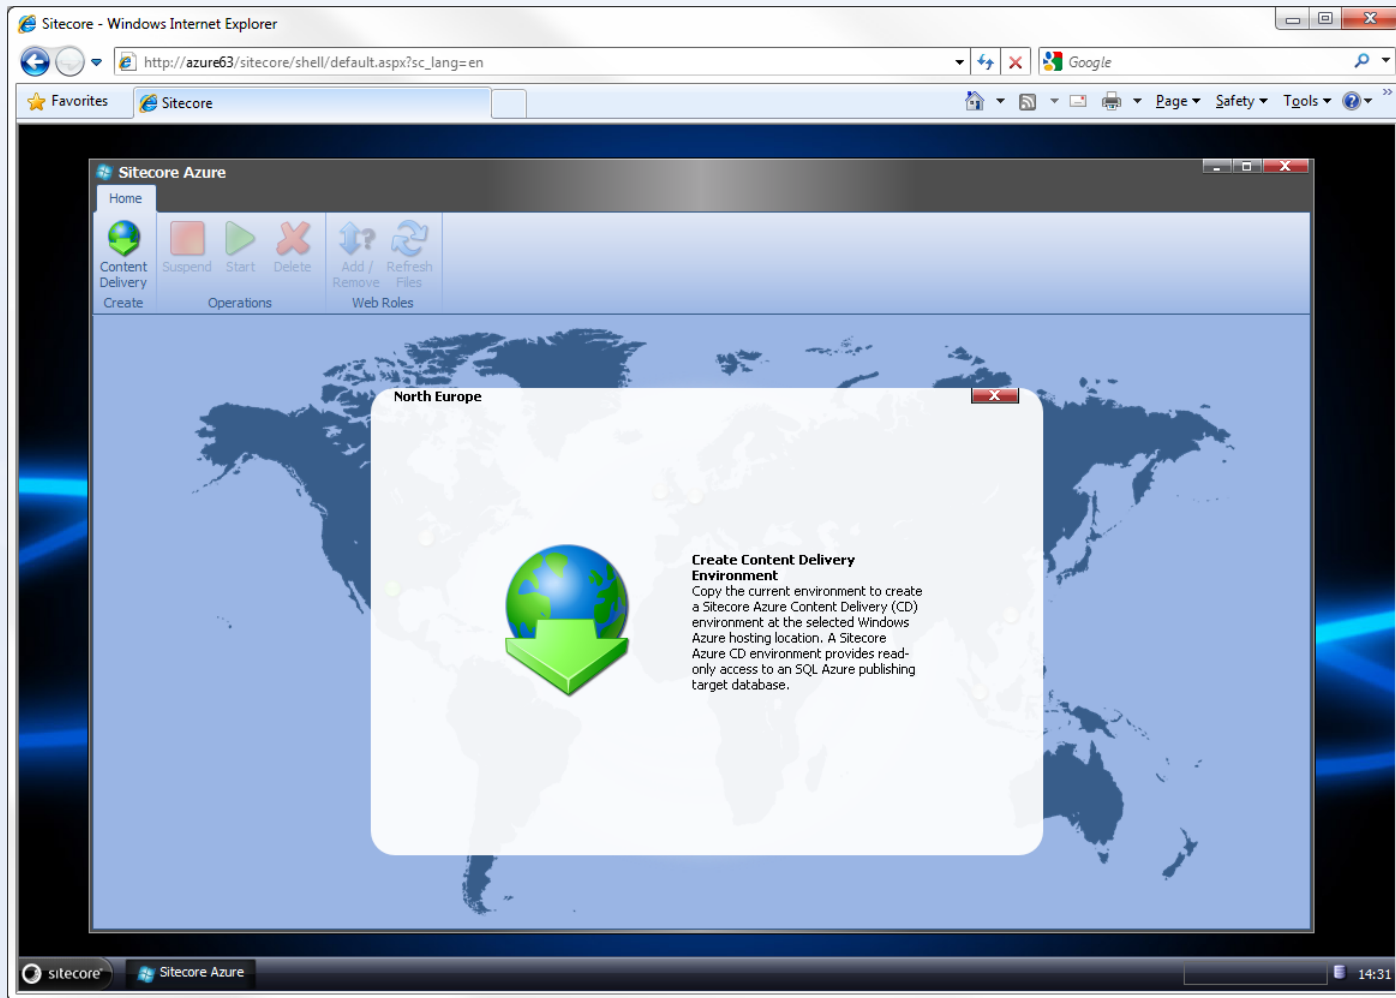

Sitecore Azure Application

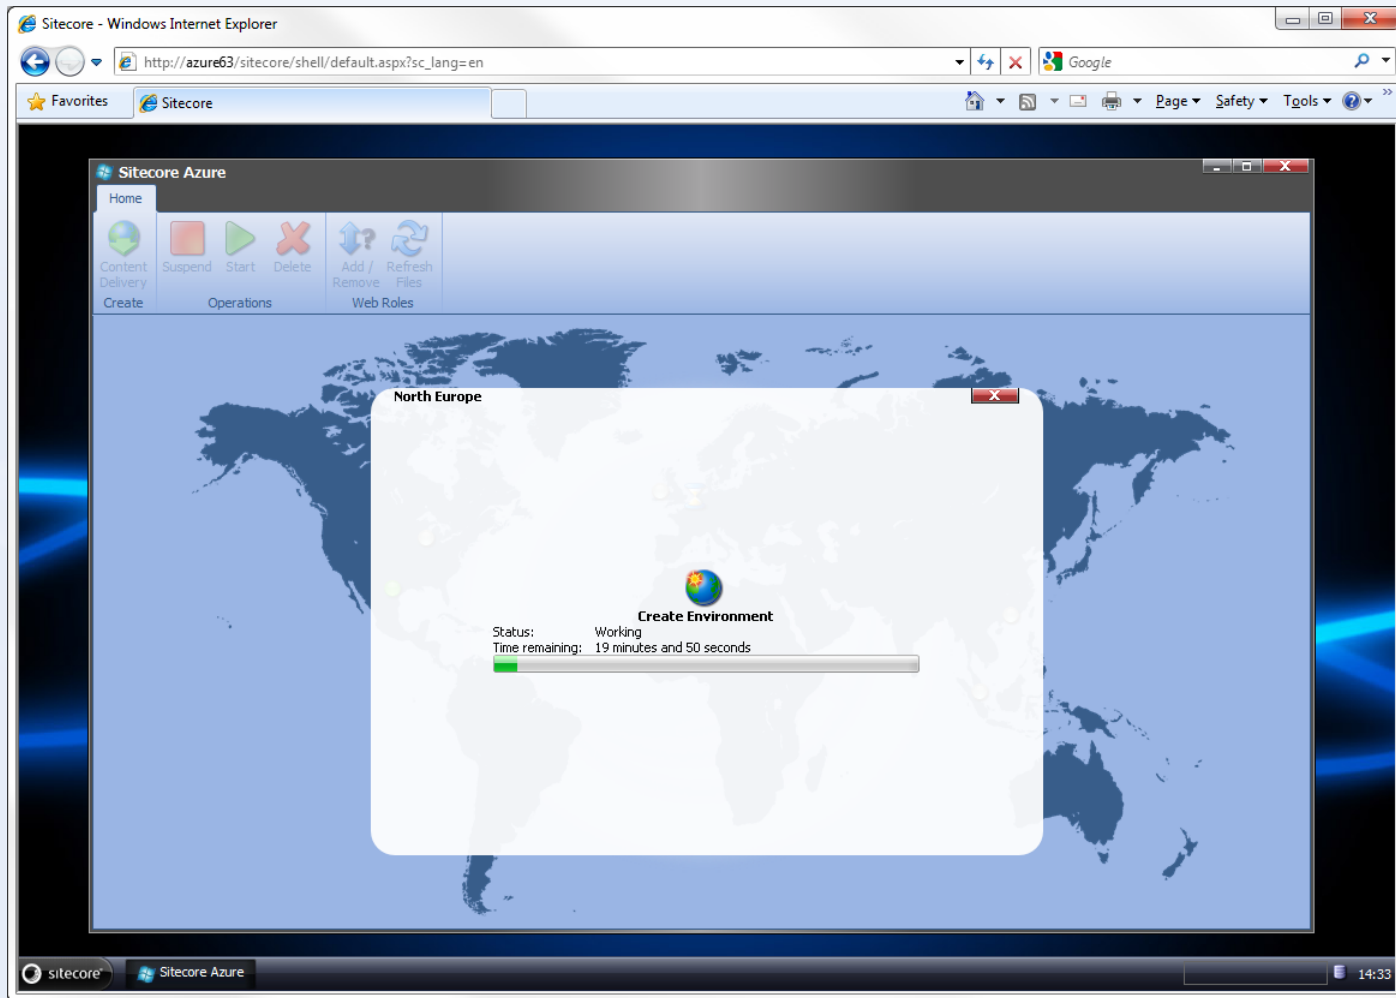

Sitecore Azure Application

Sitecore Azure Application

Sitecore Azure Application

Windows Azure Service Management REST API

- Control hosted services
- Create, update, swap and delete deployments
- Operate and get status on deployments
- Change sizing of environments
- Maintain certificates
- Get information about storage accounts

sitecore[®] azure

Web Roles

Web Roles

- Everything be able ton run multiple instances at once
- Web Roles can at any time be spun up / down, so must be stateless or able to recreate stats
- No disk access
- No support for legacy code

Converting Sitecore to Web Roles

- Sitecore consists of ~31 MB of compiled code
- Supports multiple web instances
- Can recreate state
- Not a single line was changed in order to support the Windows Azure platform
- Only changes done to Web Roles where configuration

sitecore[®] azure

Databases

Databases

- Must have clustered index
- Only one database server location pr. subscription
- No database replication (sync is available)
- Database size limitation

sitecore[®] azure

Latency

Latency

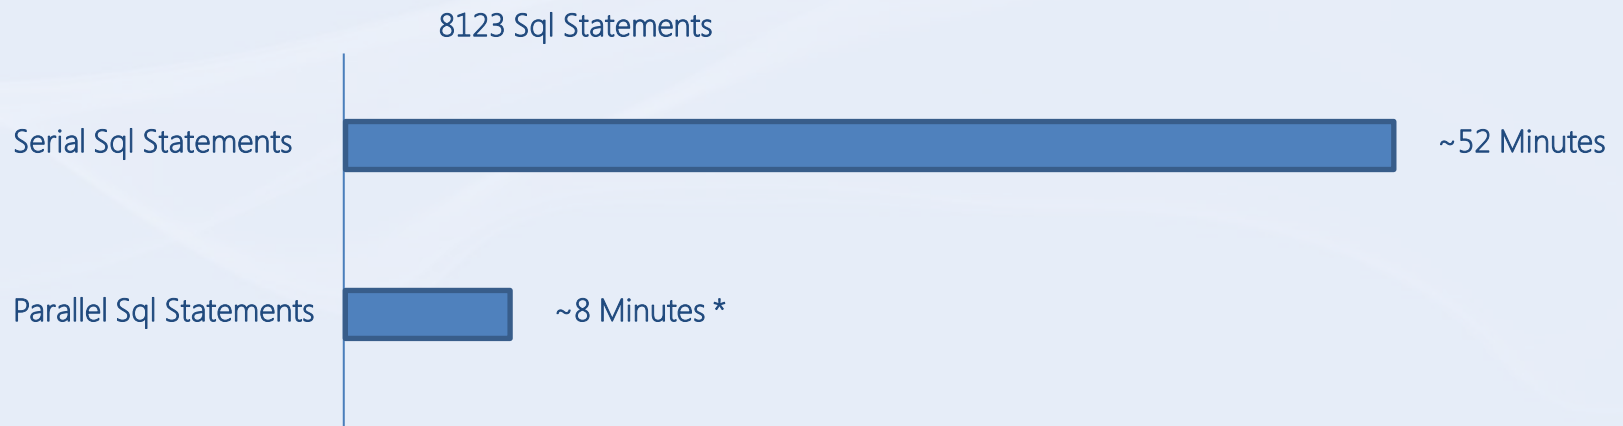

- Database responses from Web Roles where as expected
- Updating or Creating database from on-premise Production servers was slow due to latency
- Utilization of the bandwidth was very poor

Latency

Regional Averages (Averages of groups of city-pairs within the listed region)	Last 12 Months Averages	09/10	08/10	07/10	06/10	05/10	04/10	03/10	02/10	01/10	12/09	11/09	10/09

Latency

- Small 70mb database deployment from Los Angeles to Singapore (avg. 185ms)

* The statement was now limit to bandwidth and server throughput

sitecore[®] azure

Database Sharding

Database Sharding

- Span your data across multiple databases
- Addresses database space limitations
- Ability to scale throughput
- Cost of 1x20GB is the same as 2x10GB
- Endless database size

Database Sharding

Principle behind database sharding

Database Sharding

- Scale out to two databases

sitecore[®] azure

SQL Fault tolerance

Fault tolerance

- With software redundancy you can expect the server to close you connection.
- Faults will probably be more frequent when running on WAN then LAN.
- You should add retry capabilities to you application, to remove or reduce this.
