Real-World Scala

Jonas Bonér

Scalable Solutions

If I were to pick a language
to use today other than Java,
it would be Scala

James Gosling

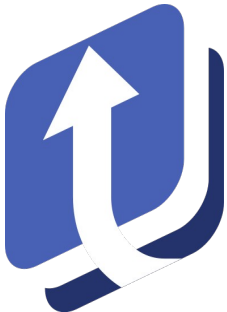
Chat app in Lift

Build a multi-user, comet-based chat app

About 30 lines of code

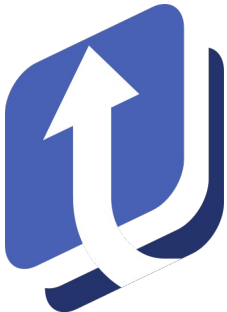
Three slides worth

Slides By David Pollak, creator of Lift



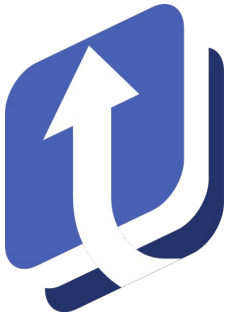
Define Messages

```
case class Add(who: Actor)
case class Remove(who: Actor)
case class Messages(msgs: List[String])
```



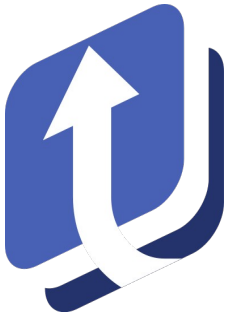
Chat Server

```
object ChatServer extends Actor {
  private var listeners: List[Actor] = Nil
  private var msgs: List[String] = Nil
  def act = loop {
    react {
      case s: String =>
        msgs = s :: msgs
        listeners.foreach(l => l ! Messages(msgs))
      case Add(who) =>
        listeners = who :: listeners
        who ! Messages(msgs)
      case Remove(who) => listeners -= who
    }
  }
  this.start
}
```



Chat Comet Component

```
class Chat extends CometActor {
  private var msgs: List[String] = Nil
  def render =
    <div>
      <ul>{ msgs.reverse.map(m => <li>{ m }</li>) }</ul>
      { ajaxText("", s => { ChatServer ! s; Noop }) }
    </div>
  override def localSetup = ChatServer ! Add(this)
  override def localShutdown = ChatServer ! Remove(this)
  override def lowPriority = {
    case Messages(m) => msgs = m; reRender(false)
  }
}
```



Demo

Scalable language

OO + FP

Martin Odersky

Pragmatic

Since 2001

Sponsored by EPFL

Seamless Java interoperability

Friendly and supportive community

Production ready

Runs on the JVM

Statically typed

is...

Expressive & light-weight

```
val phonebook = Map(
  “Jonas” -> “123456”,
  “Sara”  -> “654321”)
phonebook += (“Jacob” -> “987654”)
println(phonebook(“Jonas”))
```

High-level

Java version

```
boolean hasUpperCase = false;
for (int i = 0; i < name.length(); i++) {
  if (Character.isUpperCase(name.charAt(i)))
  {
    hasUpperCase = true;
    break;
  }
}
```

High-level

Scala version

```
val hasUpperCase = name.exists(_.isUpperCase)
```

Concise

```
// Java
public class Person {
 private String name;
 private int age;
 public Person(String name,
               int age) {
   this.name = name;
   this.age = age;
 }
 public String getName() {
   return name;
 }
 public int getAge() {
   return age;
 }
 public void setName(String name) {
   this.name = name;
 }
 public void setAge(age: int) {
   this.age = age;
 }
}
```

```
// Scala
class Person(
  var name: String,
  var age: Int)
```

Pure OO

```
1 + 2
1.+(2)
```

```
123.toString()
```

Extensible

```
val service = actor {
  loop {
    receive {
      case Add(x,y) => reply(x+y)
      case Sub(x,y) => reply(x-y)
    }
  }
}
service ! Add(4, 2)
```

➔ 6

Pragmatic

```
def users =
  <users>
    <user role=”customer”>
      <name>{ user.name }</name>
      <password>{ user.password }</password>
      <email>{ user.email }</email>
    </user>
    ...
  </users>
```

Pragmatic

```
users match {
  case <users>{users @ _*}</users> =>
    for (user <- users)
      println("User " + (user \ "name").text)
}
```

Great for DSLs

Apache Camel

```
“direct:a“ ==> {
  loadbalance roundrobin {
    to (“mock:a“)
    to (“mock:b“)
    to (“mock:c“)
  }
}
```

Scala is

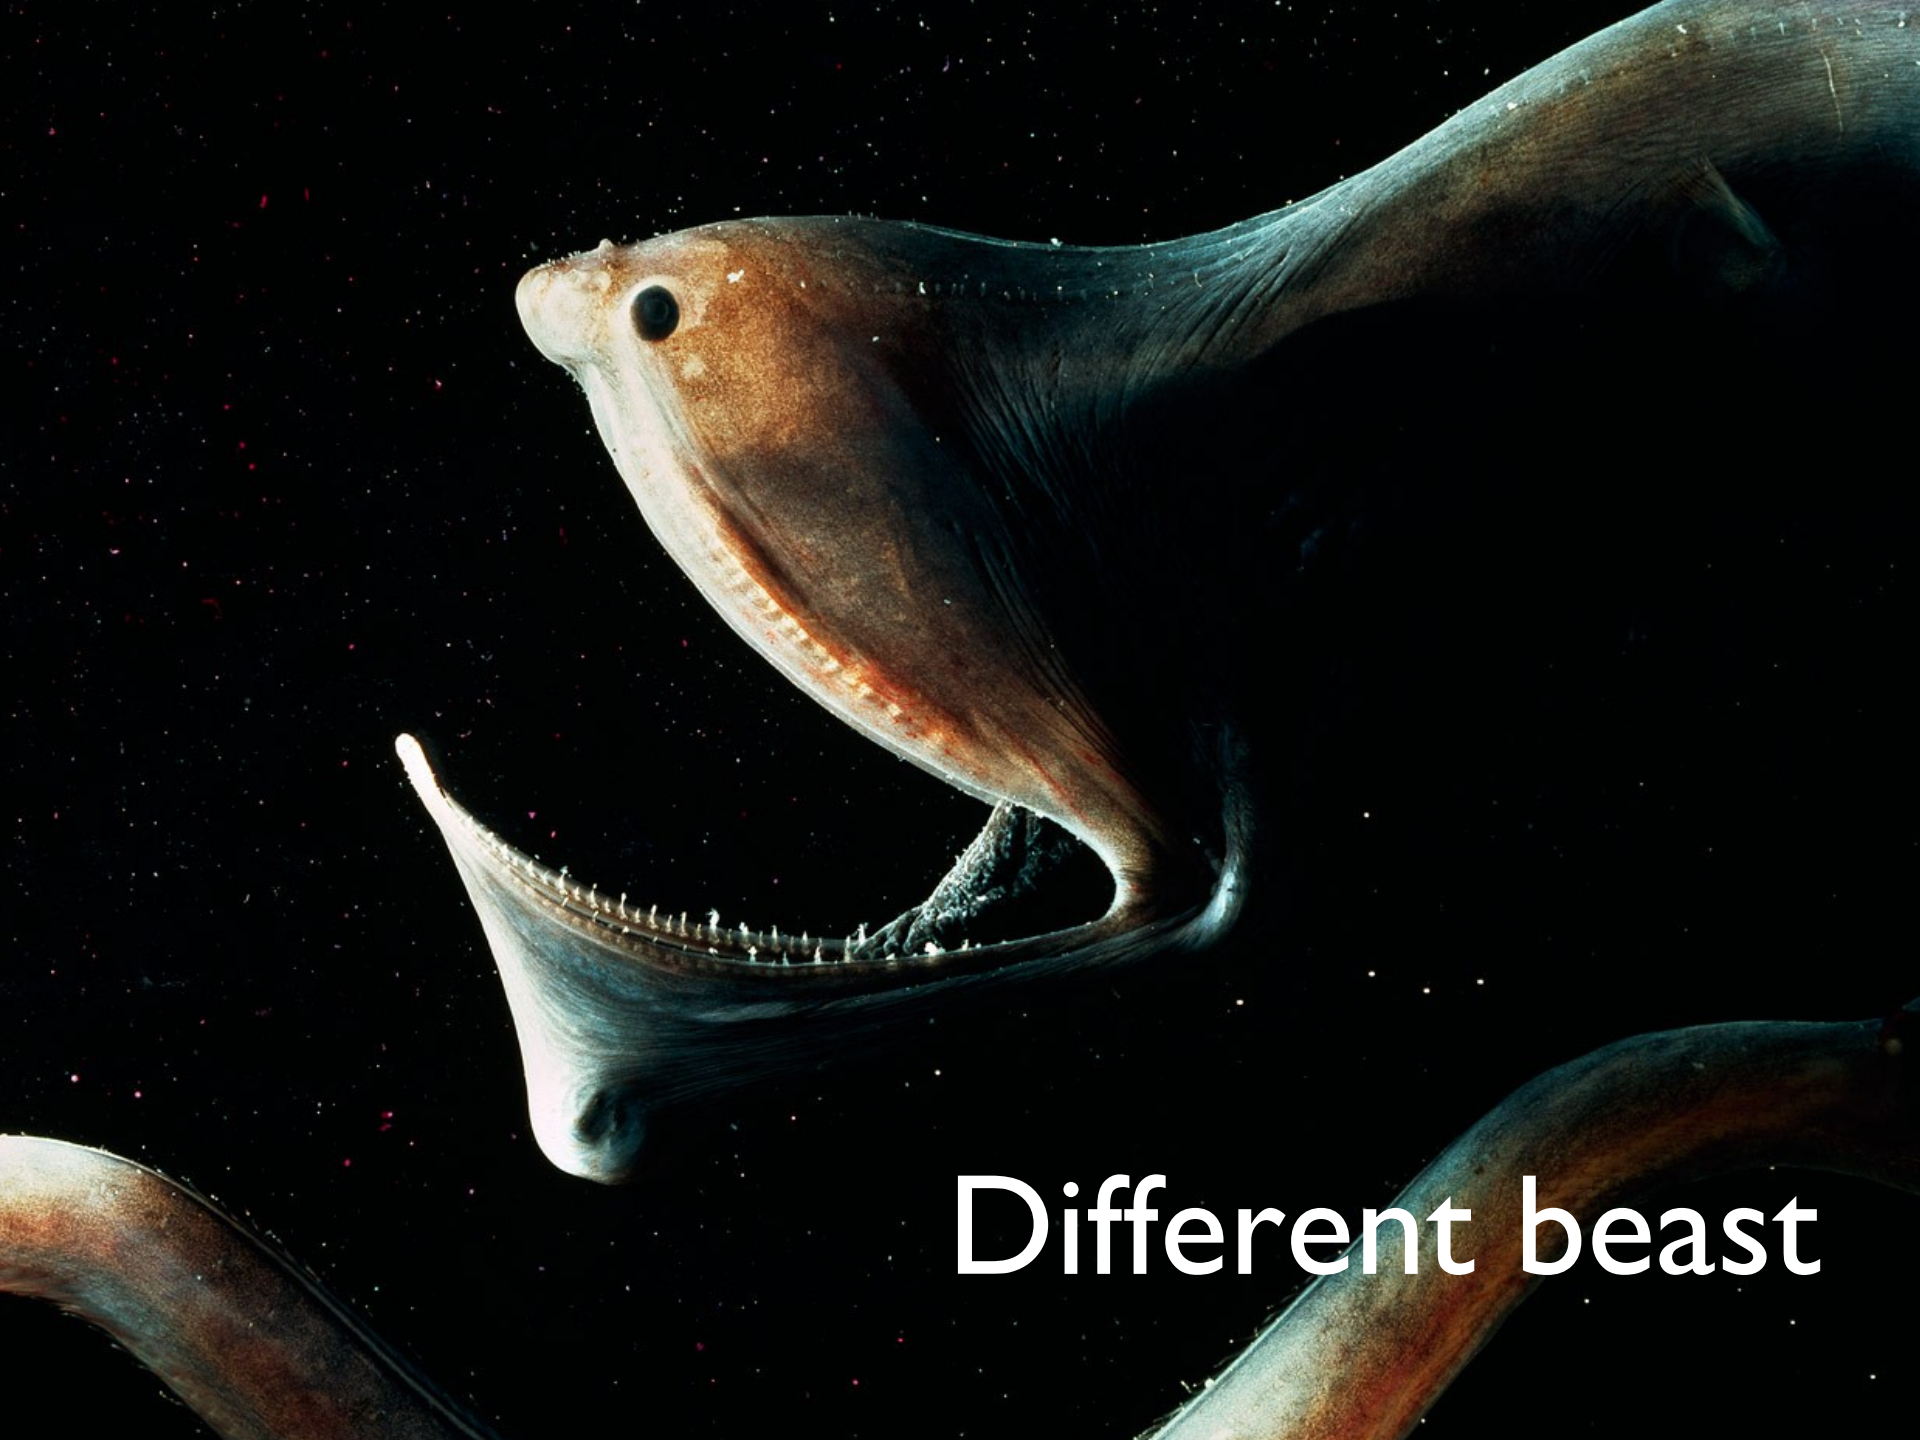
deep

But you don't need to go very deep

to still have fun and be productive

Java

Tastier Java



Different beast

Composition

Composition

2

building blocks

Traits

&

Self-type annotations

Trait

```
trait Dad {
  private var children: List[Child] = Nil

  def addChild(child: Child) =
    children = child :: children

  def getChildren = children.clone
}
```

Base

```
class Man(val name: String) extends Human
```

Plumbing

Static mixin composition

```
class Man(val name: String) extends Human with Dad
```

Static mixin composition usage

```
class Man(val name: String) extends Human with Dad
```

```
val jonas = new Man("Jonas")
jonas.addChild(new Child("Jacob"))
```

Dynamic mixin composition

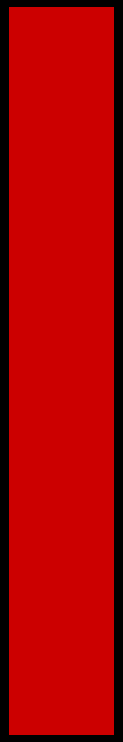
```
val jonas = new Man("Jonas") with Dad
```

Dynamic mixin composition usage

```
val jonas = new Man("Jonas") with Dad
```

```
jonas.addChild(new Child("Jacob"))
```

3 different type of traits



Rich interface

```
trait RichIterable[A] {
  def iterator: Iterator[A] // contract method

  def foreach(f: A => Unit) = {
    val iter = iterator
    while (iter.hasNext) f(iter.next)
  }

  def foldLeft[B](seed: B)(f: (B, A) => B) = {
     var result = seed
     foreach(e => result = f(result, e))
     result
   }
}
```

Rich interface

```
val richSet =
    new java.util.HashSet[Int]
    with RichIterable[Int]

richSet.add(1)
richSet.add(2)

richSet.foldLeft(0)((x, y) => x + y)
```

➔ 3

2

Stackable modifications

```
trait IgnoreCaseSet
  extends java.util.Set[String] {

  abstract override def add(e: String) = {
    super.add(e.toLowerCase)
  }
  abstract override def contains(e: String) = {
    super.contains(e.toLowerCase)
  }
  abstract override def remove(e: String) = {
    super.remove(e.toLowerCase)
  }
}
```

Stackable modifications

```
val set =
    new java.util.HashSet[String]
    with IgnoreCaseSet

set.add("HI THERE")       // uppercase

set.contains("hi there") // lowercase
    ➔ true
```

Add another trait interceptor

```
trait LoggableSet
  extends java.util.Set[String] {

  abstract override def add(e: String) = {
    println("Add :" + e)
    super.add(e)
  }

  abstract override def remove(e: String) = {
    println("Remove :" + e)
    super.remove(e)
  }
}
```

Run the stack of interceptors

```
val set =
  new java.util.HashSet[String]
  with IgnoreCaseSet
  with LoggableSet

set.add("HI THERE")
  ➔ "Add: HI THERE"
```

Prints in uppercase

Change the order

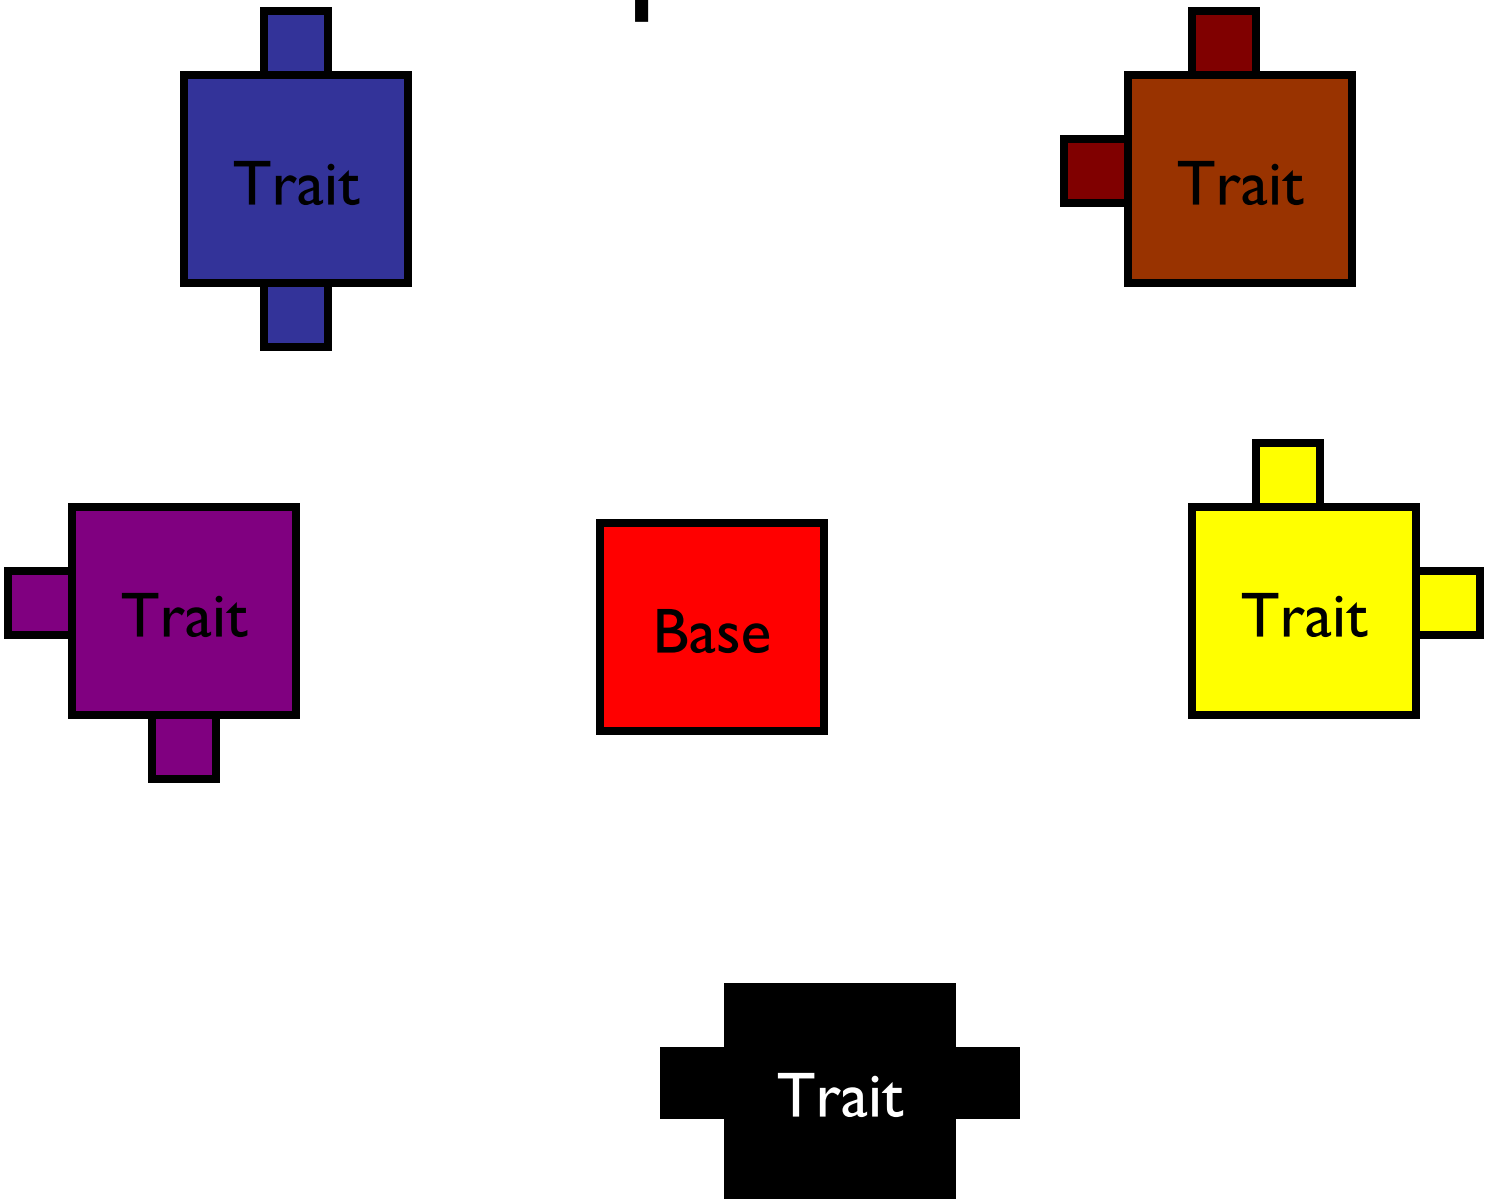
```
val set =
  new java.util.HashSet[String]
  with LoggableSet
  with IgnoreCaseSet

set.add("HI THERE")
  ➔ "Add: hi there"
```

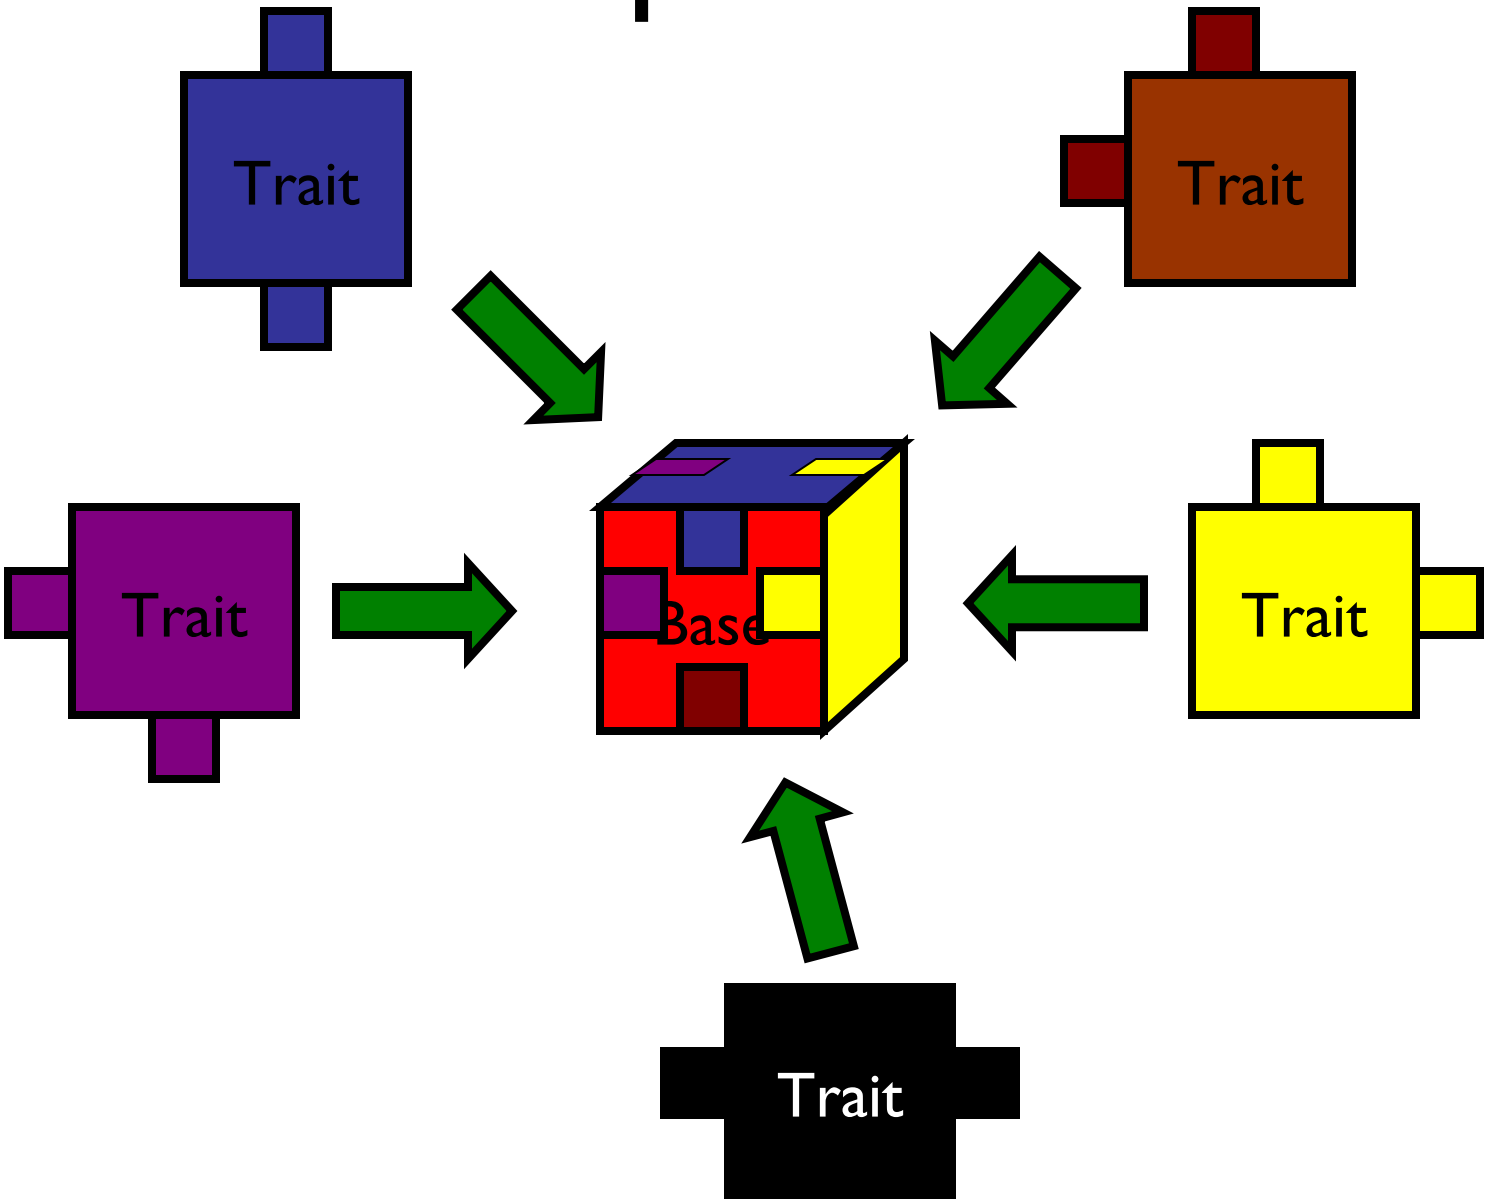
Prints in lowercase

3

Multiple views



Multiple views



Traits

Multiple
personalities

Traits
Multiple
facets

Base

```
class Order(val cust: Customer)
```

Facets

```
trait Entity { ... }
trait InventoryItemSet { ... }
trait Invoicable { ... }
trait PurchaseLimiter { ... }
trait MailNotifier { ... }
trait ACL { ... }
trait Versioned { ... }
trait Transactional { ... }
```

Composition

```
val order = new Order(customer)
    with Entity
    with InventoryItemSet
    with Invoicable
    with PurchaseLimiter
    with MailNotifier
    with ACL
    with Versioned
    with Transactional
```

Modules / Namespaces

Modules

```
object Module {
   ...
}
```

...are effectively singletons

Modules

```
trait UserRepository { ... }
trait CartRepository { ... }
```

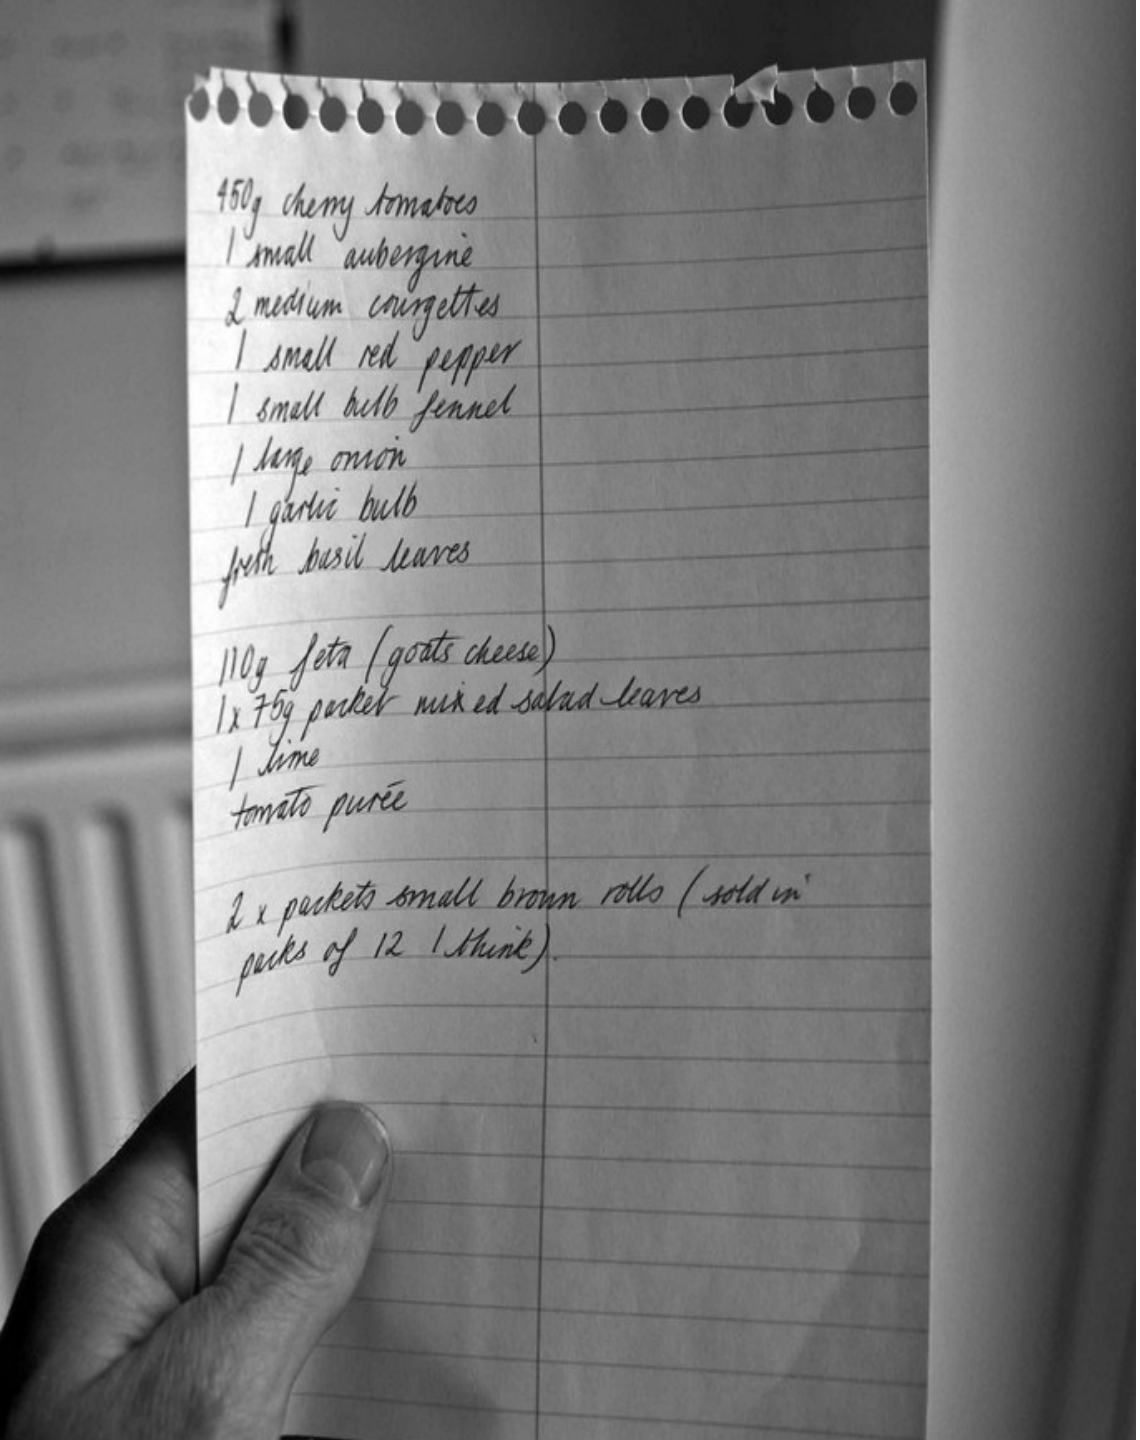
```
object Persistence extends Layer
  with UserRepository
  with CartRepository
  ...
```

...can be composed of traits

Glue it together

```
trait UserRepositoryComponent {
  val userRepository = new UserRepository
  class UserRepository { ... }
}
```

```
trait UserServiceComponent {
  val userService = new UserService
  class UserService {
    def authenticate(name: String, pwd: String) =
      userRepository.authenticate(name, pwd)
  }
}
```



What do we need?

We need the

userRepository

```
userRepository.authenticate(name, pwd)
```

DI

```
this: <deps> =>
```

Dependency declaration

```
trait UserService {
  this: UserRepository =>
  ...
  // provided with composition
  userRepository.merge(user)
}
```

...using self-type annotation

scala dependency injection

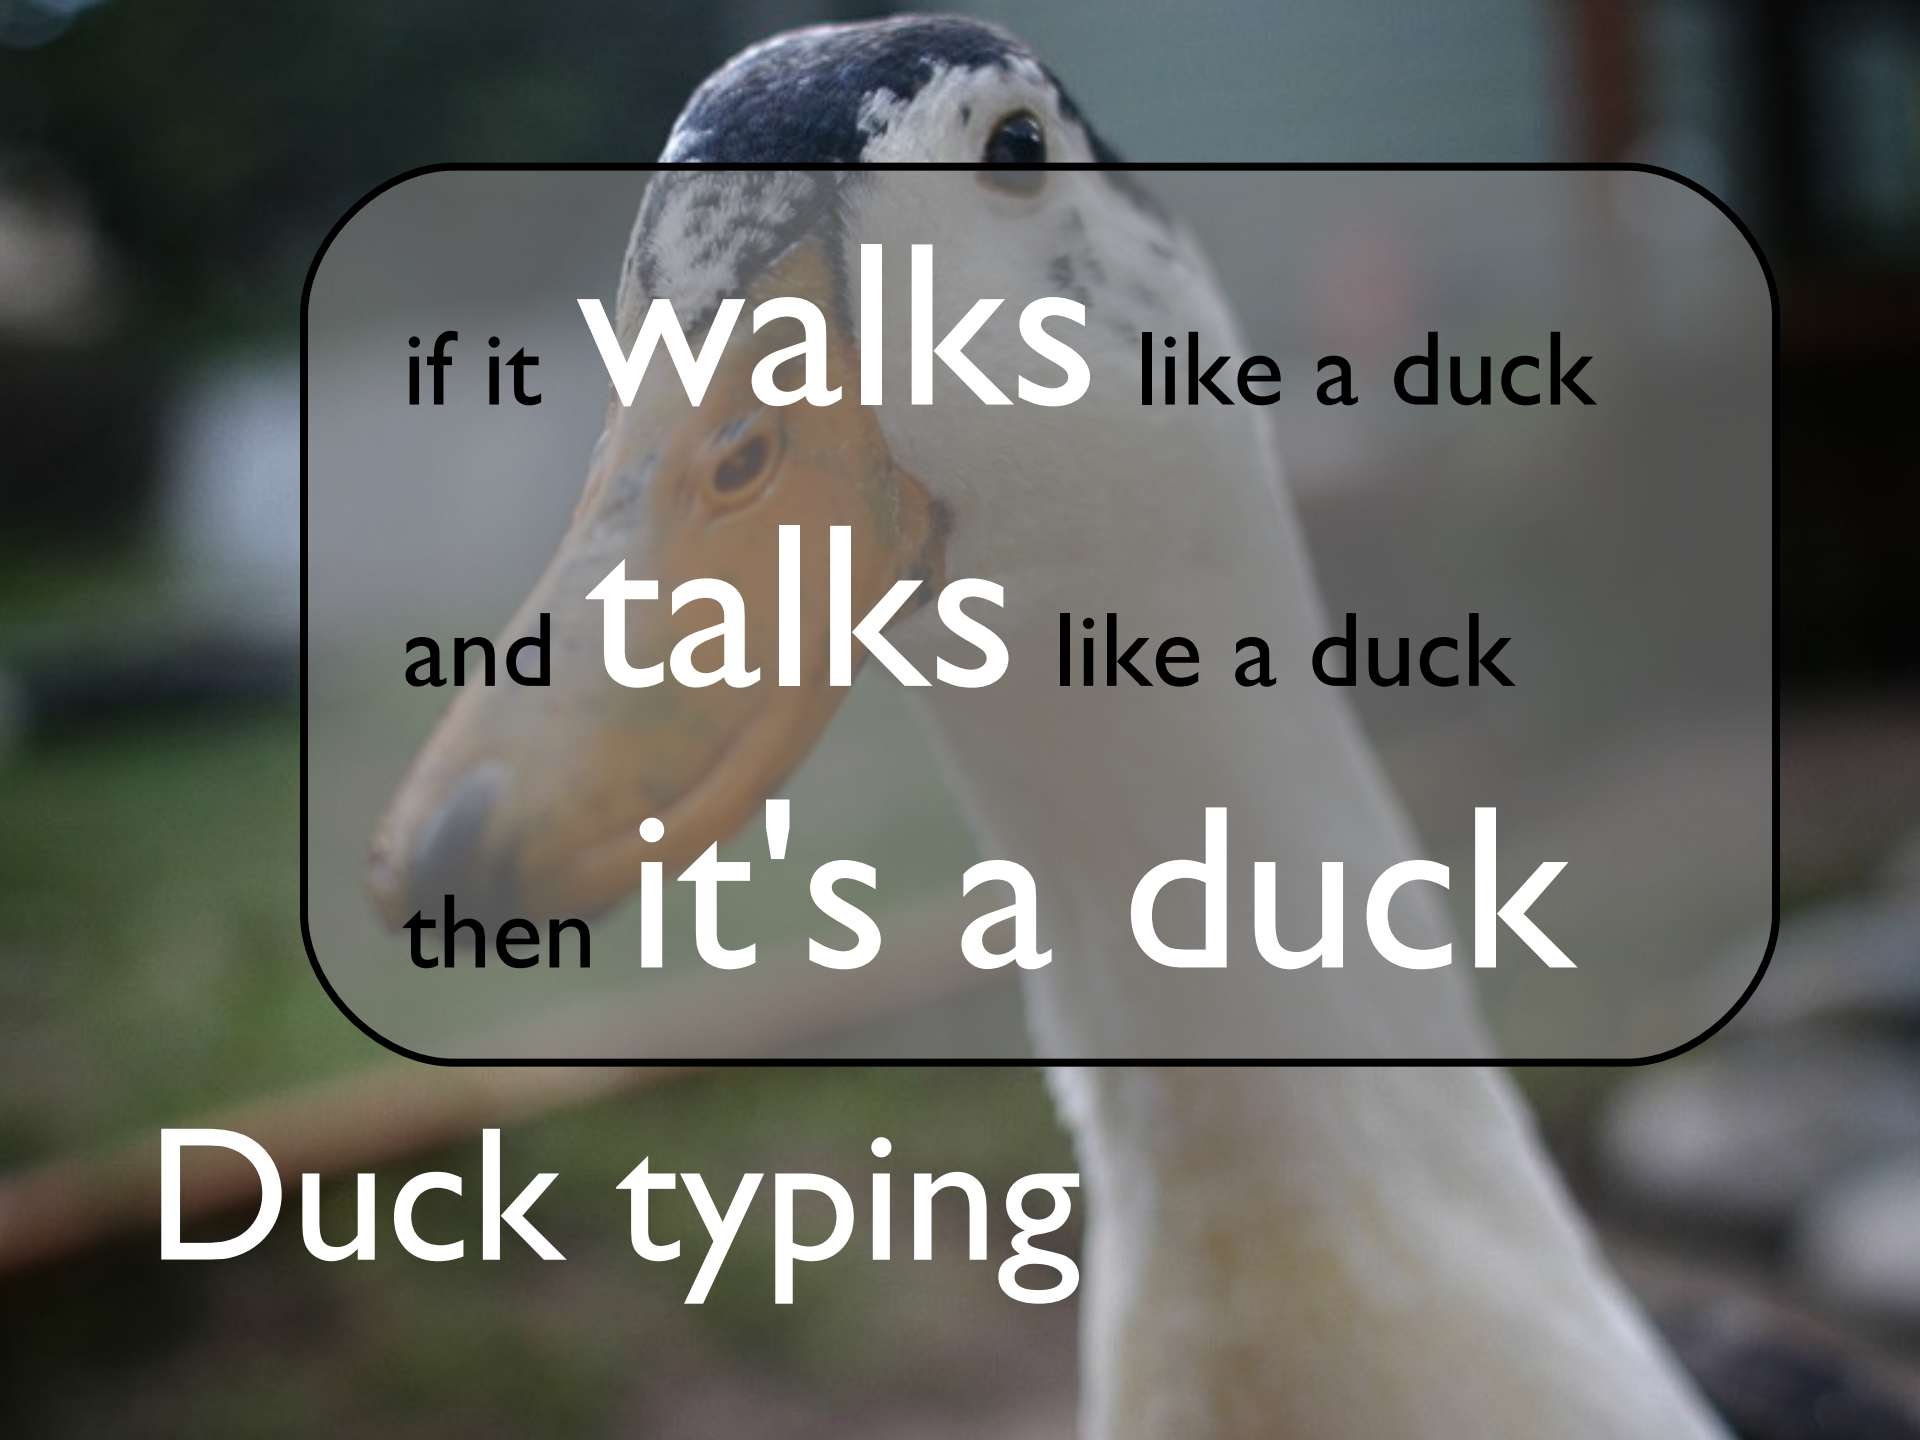
Duck typing



Duck typing

Structural Typing:

Duck-typing done right

```
def authorize(target: { def getACL: ACL }) = {

  val acl = target.getACL
  ... //authorize
}
```

Statically enforced

Composition

“It's Time to Get Good at Functional Programming”

Dr Dobb's Journal
Issue December 2008

What's all the buzz about?

Deterministic

High-level

Reusable

FP

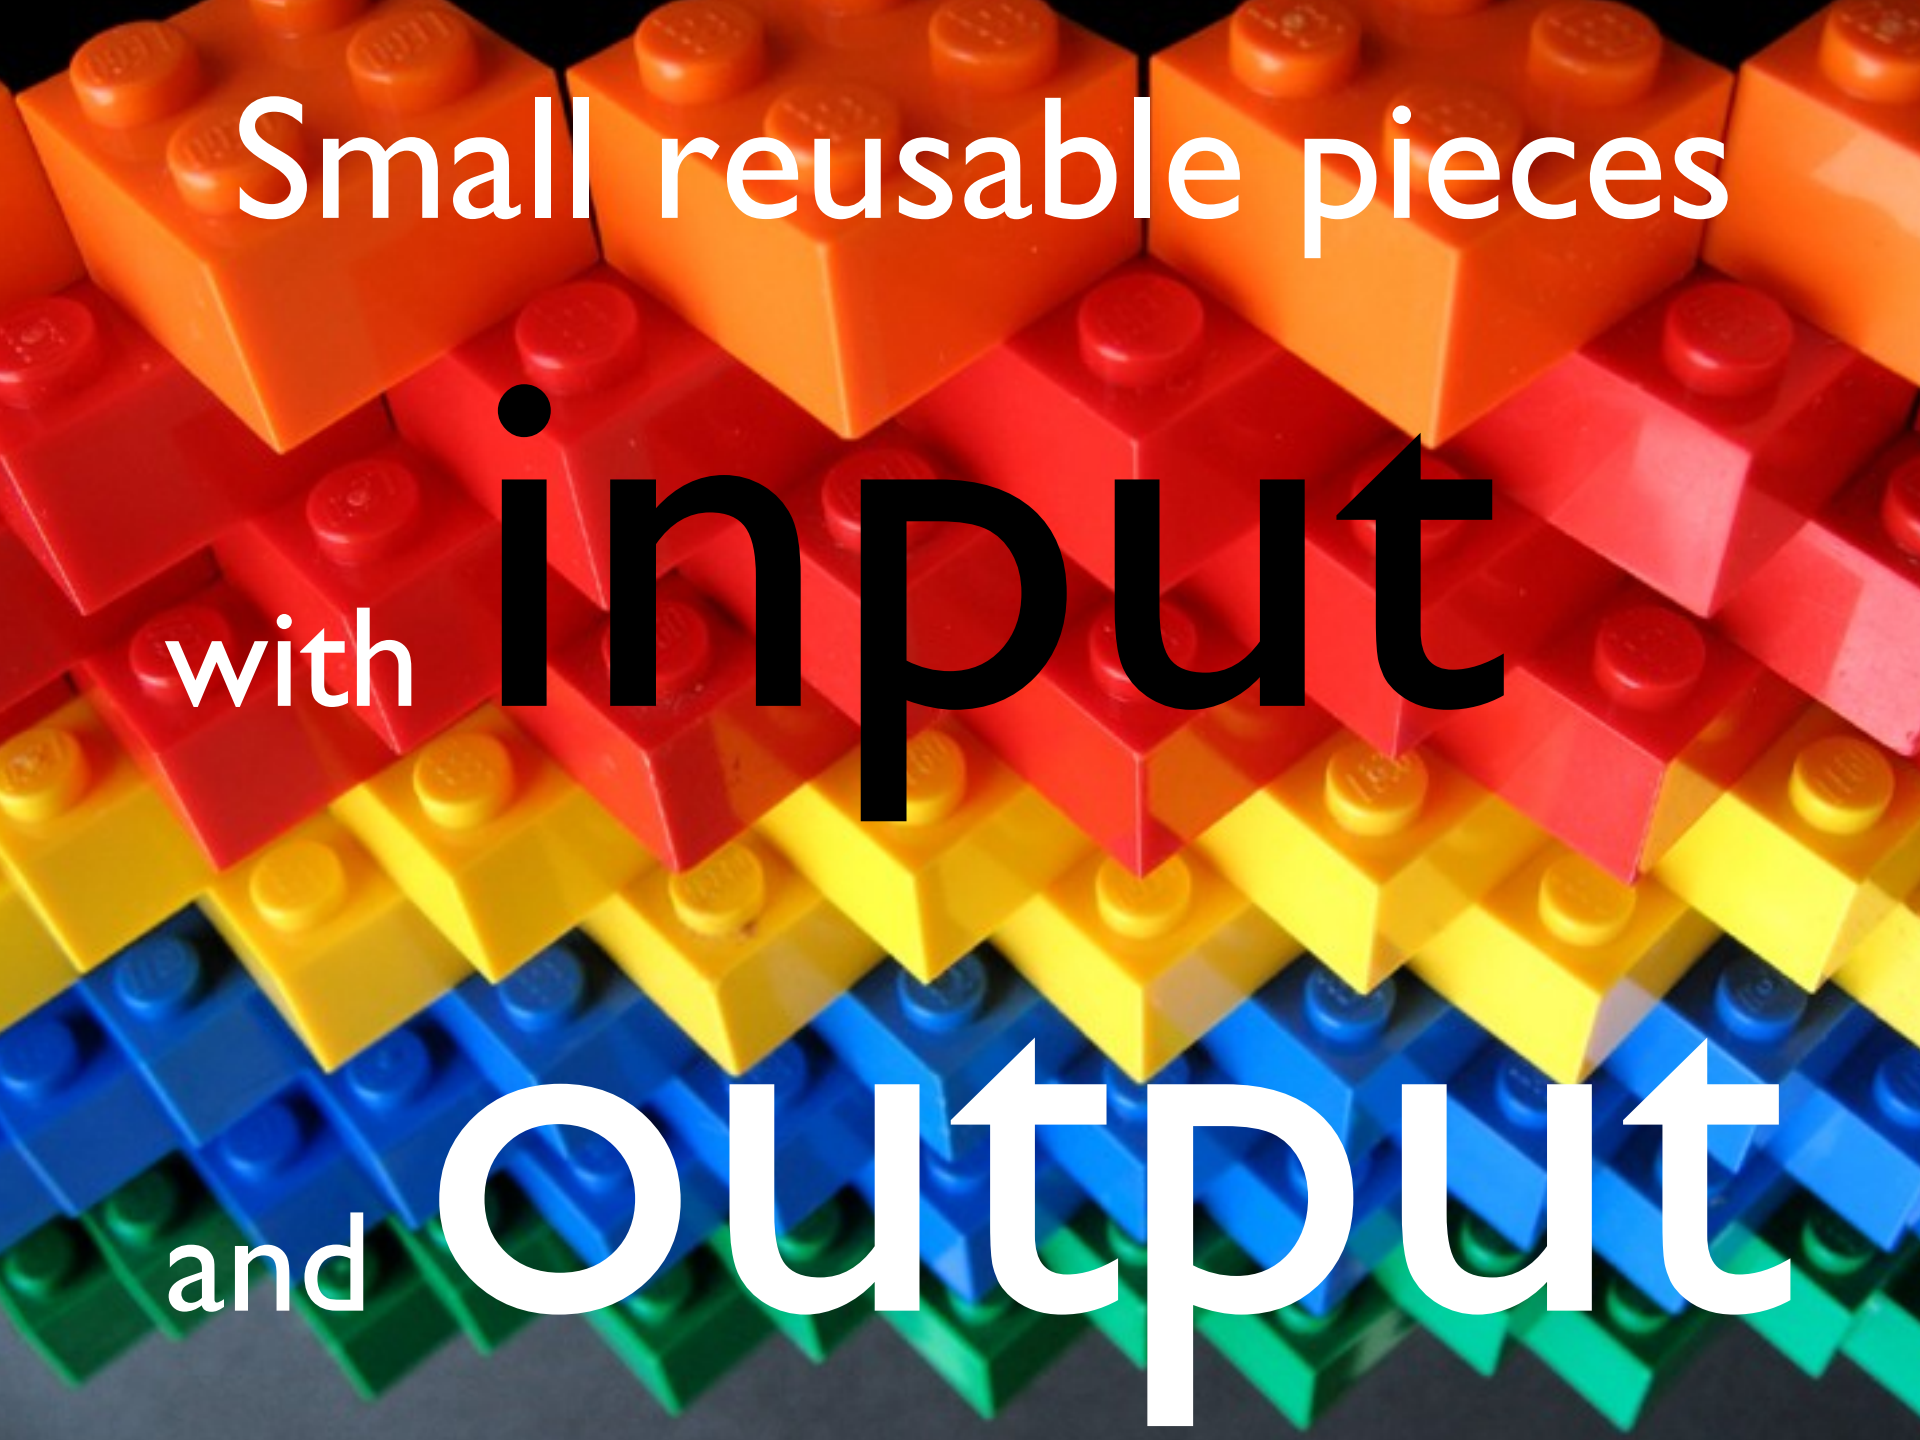
Referentially transparent

Immutable

Declarative

Orthogonal

FP is like
Lego



Small reusable pieces
with input
and output

Unix pipes

```
cat File | grep 'println' | wc
```

Functions

```
(x: Int) => x + 1
```

Functions as values

```
val inc = (x: Int) => x + 1
```

```
inc(1)  ➔ 2
```

Functions as parameters

high-order

```
List(1, 2, 3).map((x: Int) => x + 1)
```

➔ `List(2, 3, 4)`

Functions as parameters

with sugar

```
List(1, 2, 3).map((x: Int) => x + 1)
```

```
List(1, 2, 3).map(x => x + 1)
```

```
List(1, 2, 3).map(_ + 1)
```

Functions as closures

```
val addMore = (x: Int) => x + more
```

What is more?

A free variable outside the function's lexical scope

```
var more = 7
val addMore = (x: Int) => x + more
```

```
addMore(3) ➔ 10
more = 8
addMore(3) ➔ 11
```

Partial application

Currying

```
val add = (x: Int, y: Int) => x + y

val add2 = add(2, _: Int)

add2(3) ➔ 5
```

Functional

Data Structures

Immutable

Recursive

The almighty

List

Lists

Grow at the front

Insert at front ➔ O(1)

Insert at end ➔ O(n)

List creation

```
List(1, 2, 3)
```

```
1 :: 2 :: 3 :: Nil
```

Basics

```
val list = List(1, 2, 3)
list.head    ➔ 1
list.tail    ➔ List(2, 3)
list.isEmpty ➔ false
```

High-level operations

```
val list = List(1, 2, 3)
list.map(_ + 1)       ➔ List(2, 3, 4)
list.filter(_ < 2)    ➔ List(1)
list.exists(_ == 3)   ➔ true
list.drop(2)          ➔ List(3)
list.reverse          ➔ List(3, 2, 1)
list.sort(_ > _)      ➔ List(3, 2, 1)
List.flatten(list)    ➔ List(1, 2, 3)
list.slice(2, 3)      ➔ List(3)
...
```

115

functions defined on List

Tuples

```
def getNameAndAge: Tuple2[String, Int] = {
  val name = ...
  val age = ...
  (name, age)
}
```

```
val (name, age) = getNameAndAge
println("Name: " + name)
println("Age: " + age)
```

Other

functional data structures:

Sets

Trees

Stacks

for

comprehensions

```
for (n <- names)
  println(n)
```

Like SQL queries

```
for {
  att <- attendees
  if att.name == “Fred”
  lang <- att.spokenLanguages
  if lang == “Danish”
} println(att)
```

Find all attendees named Fred that speaks Danish

for / yield

```
val companiesForAttendeesFromLondon =
  for {
    att <- attendees
    if att.address.city == “London”
  } yield att.company
```

Everything returns a value

```
for (thing <- thingsFromHere)
yield getRealThing(thing)
```

Everything returns a value

```
val things =
  for (thing <- thingsFromHere)
  yield getRealThing(thing)
```

Everything returns a value

```
if (fromHere) {
  for (thing <- thingsFromHere)
  yield getRealThing(thing)
} else {
  for (thing <- thingsFromThere)
  yield thing
}
```

Everything returns a value

```
val things =
  if (fromHere) {
    for (thing <- thingsFromHere)
    yield getRealThing(thing)
  } else {
    for (thing <- thingsFromThere)
    yield thing
  }
```

Everything returns a value

```
try {
  if (fromHere) {
    for (thing <- thingsFromHere)
    yield getRealThing(thing)
  } else {
    for (thing <- thingsFromThere)
    yield thing
  }
} catch {
  case e => error(e); Nil
}
```

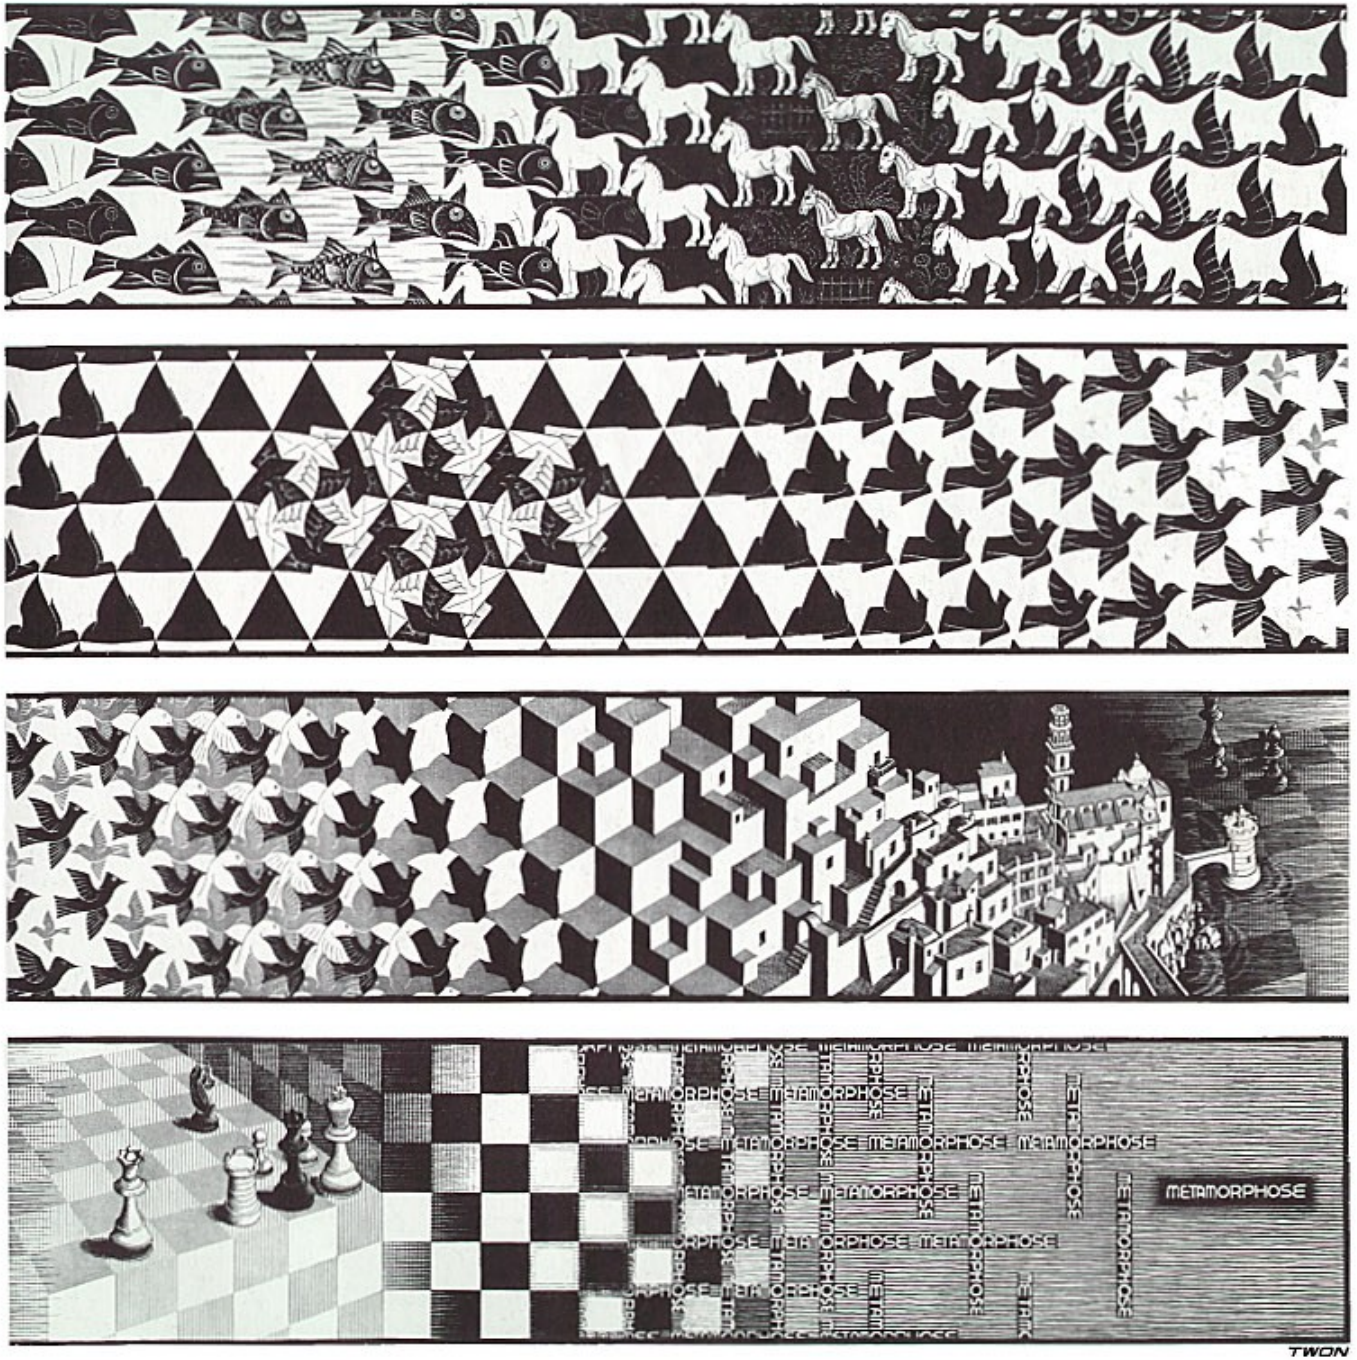
Everything returns a value

```
val things =
  try {
    if (fromHere) {
      for (thing <- thingsFromHere)
      yield getRealThing(thing)
    } else {
      for (thing <- thingsFromThere)
      yield thing
    }
  } catch {
    case e => error(e); Nil
  }
```

Everything returns a value

```
def getThingsFromSomewhere(
  fromHere: Boolean): List[Thing] = {
  try {
    if (fromHere) {
      for (thing <- thingsFromHere)
      yield getRealThing(thing)
    } else {
      for (thing <- thingsFromThere)
      yield thing
    }
  } catch {
    case e => error(e); Nil
  }
}
```

Pattern
matching



Pattern matching

```
def matchAny(a: Any): Any = a match {
  case 1                          => “one”
  case “two”                      => 2
  case i: Int                     => “scala.Int”
  case <tag>{ t }</tag>           => t
  case head :: tail               => head
  case _                          => “default”
}
```

Case classes

```
// compiler adds: toString(), hashCode(),
// equals() + companion object with apply()
sealed abstract case class Man
case class Bill(age: Int) extends Man
case class Ben(age: Int) extends Man
```

```
val guy = Ben(45)
guy match {
  case Bill(age) => println("Bill " + age)
  case Ben(age) =>  println("Ben " + age)
}
```

Persistence

JPA

```
@Entity
@Inheritance {
  val strategy = InheritanceType.JOINED
}
@DiscriminatorColumn {
  val name = "portfolio_item_type",
  val discriminatorType =
    DiscriminatorType.STRING
}
@serializable
class Portfolio(...) {
  ...
}
```

JPA cont.

```
class Portfolio(...) {
  @Id
  @GeneratedValue {
    val strategy = GenerationType.IDENTITY
  }
  val id: PortfolioId = _id

  @ManyToOne
  @JoinColumn { val name = "strategy_id" }
  val strategy: Strategy = _strategy

  ...
}
```

Domain Specific Languages

1. Flexible syntax

```
// from Apache Camel Scala DSL
class MyRouteBuilder extends RouteBuilder {
  “direct:a“ --> “mock:a“
  “direct:b“ to  “mock:b“
}
```

1. Flexible syntax

```
// from Apache Camel Scala DSL
class MyRouteBuilder extends RouteBuilder {
  “direct:a“.-->(“mock:a“)
  “direct:b“.to(“mock:b“)
}
```

2. Implicits

```
// from Apache Camel Scala DSL
class MyRouteBuilder extends RouteBuilder {
  “direct:a“ --> “mock:a“
  “direct:b“ to  “mock:b“
}
```

how can they invoke a method `-->` on String?

2. Implicits

```
implicit def stringToRoute(route: String)
  = new CamelRoute(str)

class CamelRoute(route: String) {
  def -->(route: String) = { ... }
  def to(route: String) = { ... }
}
```

allows you to define methods on existing classes

2. Implicits

```
// from Apache Camel Scala DSL
class MyRouteBuilder extends RouteBuilder {
  (new CamelRoute(“direct:a“)).-->(“mock:a“)
  (new CamelRoute(“direct:b“)).to(“mock:b“)
}
```

Compiler generation

3. Operator overloading

```
class CamelRoute(route: String) {
  ...
  // unification of two routes
  def == (route: String): Route = { ... }
}
```

```
“direct:a“ == “mock:a“
```

4: Call-by-name

```
def myAssert1(predicate: () => Boolean) =
  if (assertionsEnabled && !predicate())
  throw new AssertionError

myAssert1(() => 5 > 3) // ok, but ugly
```

```
def myAssert2(predicate: => Boolean) =
  if (assertionsEnabled && !predicate)
  throw new AssertionError

myAssert2(5 > 3) // like build into lang
```
